

3rd September 2018

To whom it may concern

I have examined a molly hen ring number GB 17
F 21090 at my hospital today. The end two
wing flight feathers are worn compared to the remaining
primary flight feathers, which is consistent with a
juvenile bird bred in January or later. The body is one
of a juvenile rather than older bird.
In my opinion, this bird is a young bird.
